Please verify you have the most recent version of this document. See here for Trial Implementation and Final Text versions and here for Public Comment versions.
Foreword

This is a supplement to the IHE Patient Care Coordination Technical Framework V10.0. Each supplement undergoes a process of public comment and trial implementation before being incorporated into the volumes of the Technical Frameworks.

This supplement is published on November 4, 2014 for trial implementation and may be available for testing at subsequent IHE Connectathons. The supplement may be amended based on the results of testing. Following successful testing it will be incorporated into the Patient Care Coordination Technical Framework. Comments are invited and may be submitted at http://www.ihe.net/PCC_Public_Comments.

This supplement describes changes to the existing technical framework documents.

“Boxed” instructions like the sample below indicate to the Volume Editor how to integrate the relevant section(s) into the relevant Technical Framework volume.

Amend Section X.X by the following:

Where the amendment adds text, make the added text bold underline. Where the amendment removes text, make the removed text bold strikethrough. When entire new sections are added, introduce with editor’s instructions to “add new text” or similar, which for readability are not bolded or underlined.

General information about IHE can be found at: www.ihe.net.

Information about the IHE Patient Care Coordination domain can be found at: http://www.ihe.net/IHE_Domains.

Information about the organization of IHE Technical Frameworks and Supplements and the process used to create them can be found at: http://www.ihe.net/IHE_Process and http://www.ihe.net/Profiles.

The current version of the IHE Patient Care Coordination Technical Framework can be found at: http://www.ihe.net/Technical_Frameworks.
Introduction to this Supplement

The Cross-enterprise Tumor Board Review Workflow Definition (XTB-WD) Profile builds upon the ITI Cross Enterprise Document Workflow (XDW) Profile to manage the workflow related to a multidisciplinary tumor board review.

The management of the workflow related to clinical process is becoming a fundamental topic with the increasing of the use by different sectors of document sharing related IHE profiles. IHE ITI has approved in Trial Implementation the Cross-Enterprise Document Workflow Profile but the work done by ITI has been on the definition of the technical structure to manage a clinical workflow and not on the definition of the clinical processes, which is the domain of Workflow Definition documents such as this.

The Cross-enterprise Tumor Board Review Workflow Definition Profile defines a typical workflow related to process of the Tumor Board Review. The definition of a workflow with fixed rules and task is needed in a scenario cross enterprise in which many actors are involved in the same process.

Open Issues and Questions

None

Closed Issues

1. **What should be the format of a XTB-WD template document?**  
   It could be just a .doc document where the different applications implement the rules inside their business logics, or it could be a more automated description (BPEL, etc.). For a linear workflow as the tumor board could be we could create a complete WD document as example and use a document to describe the rules. In the future we will define a template with IHE, but at the moment it is too early.

2. **How should XDW documents be linked to each other?**  
   In the current situation, an XDW document can be added as output document. Is this enough for linking purposes, or is a stronger linking mechanism necessary? In practice, a care pathway of a patient is described by a series of smaller XDW documents. This XDW documents series describe a part of the care pathway, and we are looking for a way to connect these XDW documents. Also, some Workflow definitions are a description of one of the tasks in another Workflow definition; see the example in Chapter 1.5. In this case, there is a kind of hierarchy in the description of the tasks, where a Task in one WD is described in more detail (and more Tasks) in another WD. We think that the Owner of a certain Task should have the possibility to register what WD he has used to perform that Task, thereby linking the two XDW documents logically together. In other words: the Owner of a Task says: these are my Input- and Output Documents, and I used WD <XYZ> for the execution of the Task. Is it possible to add a parameter to a Task that holds this kind of reference to a ‘lower-level’ Workflow definition document?
Decision: When linking Workflow definitions, there are two possibilities. The first is that at the end of a Workflow Definition, there is a link to the next phase of the process. In this case as link you have to use not the documentId of the new WD but the folderId in which the WD to be linked is (you have to use the folderId because the WD is replaced step by step and so the documentId).

3. **How should XTB-WD be tested?**

The different Tasks in a workflow can be described as ‘lightweight’ actors. These are grouped with one or more of the XDW actors (Content Creator, Content Consumer and Content Updater). By describing the actors for each Task of the workflow (grouping), the tasks that have to be performed can be described. We propose to deliver a ‘test-set’ of documents that can be used by all participants in the Connectathon, as well as some expected end-results in terms of what the XDW documents should look like at the end of each stage of the process.

At the Connectathon there will be 2 level of tests:
- basic level: the different Actors have to create/read/update (it depends by the actor tested) a WD. For example if we are testing the Actor Content Updater we will check it is able to read a WD and update it (the tests will be done in an XDS-b infrastructure)
- scenarios test: we will simulate for example a tumor board workflow with the update of the XDW step by step.

4. **Can the Owner of a certain Task change anything in another Task, such as its state or input document?**

We would advocate that this should be possible, especially if you look at the XDW documents as possible drivers for processes.

An example: after the Requestor in Task 1 (Request TBR) has written the Request Document, this document may be one of many output documents in the first Task. The Owner of the first Task knows what document is needed as Input document for the second Task. Our proposal would be, that the Owner of the first Task changes the status of that Task to ‘Completed’, and of the next Task to ‘Ready’. This could function as a trigger for any XDW-document monitoring applications to pick up the availability of a next action that has to be performed.

Decision: Yes, it is possible to create a next task and fill in some data.

NOTE: tasks that have been set to the status COMPLETED or FAILED, can still be changed to other states.

5. **Are all input- and output documents in a XDW document available to all the Tasks in the Workflow Definition?**

Decision: every document attached to any of the Tasks is available to all participants, unless they do not have the right to see these documents. The setting and enforcing of these rules are out of scope of this document.

Volume 1 – Profiles

X Cross-Enterprise Tumor Board Workflow Definition Profile

Screening, diagnosis, treatment and aftercare of oncological patients require cooperation of a multidisciplinary team of healthcare professionals. Typically, an oncological care pathway is both multidisciplinary and often cross-enterprise, including participants from different specialisms and different hospitals. In order to be able to work together and study the different patient cases, the participating specialists, radiologists, pathologists, nurses and paramedics must have access to the relevant medical information. They also need an overview of the current status of the process to see whether the required information is available.

X.1 Purpose and Scope

Tumor Board Reviews are meetings where a team of medical professionals of different professions, and often from different hospitals, get together (physically or by remote conference) to assess the cases of oncological patients (using medical images and other relevant medical information), discuss the cases, and advise on the further treatment of the patient. In many countries, the Tumor Board Review is an important phase in the multidisciplinary oncological care pathway.

Note: The specifics apply to the Dutch situation; these specifics may vary per country, or even per region. The XTB-Workflow is applicable in many different types of Tumor Board Review.

In the Netherlands, most Tumor Board Review (TBR) meetings are held for specific tumor types, such as esophageal cancer, colon cancer, lung cancer, et cetera. They are held after the diagnostic studies have been completed (pre-therapeutic TBR), and often also after the treatment of the patient (post-therapeutic). At a typical Tumor Board Review, which usually takes 1 hour, between 5 and 15 patients are being reviewed. On average, between 5 and 20 different Tumor Board meetings are held each week per hospital.

The main output of a Tumor Board Review is a report containing the collective findings, conclusions and recommendations for the further treatment of the patient. This may also include the recommendation to include a patient in a clinical research trial.

Tumor Board Review meetings also serve as a platform for sharing the latest guidelines, developments and insights in the diagnosis and treatment of the specific cancer type. The sharing of knowledge is seen as a valuable asset.

A typical TBR team consists of the following participants:

<table>
<thead>
<tr>
<th>Table X.1-1: Typical TBR Team Participants</th>

</tr>
</tbody>
</table>

Also, other healthcare professionals such as plastic surgeons, case managers, psychologists, or others may participate; in cross-enterprise settings, more than one radiologist or pathologist may participate.

The Cross-enterprise Tumor Board Workflow Definition (XTB-WD) describes the different Tasks of a Tumor Board Review process, and the accompanying information in the form of input- and output documents that are linked to the different Tasks in the process. The XTB-WD describes a relatively small part of a larger workflow definition, in this case an oncological care pathway. Other parts of the oncological pathway can be defined in a later stage, in other Workflow Definitions. The different Workflow Definitions can be seen as ‘building blocks’ that describe the actual care pathway of an individual patient. Below is a schematic overview of the place of the XTB Workflow Definition (XTB-WD) in an oncological pathway:
During a care episode, different Workflow Definition documents describe the actual steps of the care pathway. The unpredictability of the different steps or tasks in a care episode requires a flexible method that allows the total process to be divided into smaller Workflow Definitions. The XTB-Workflow Definition is one of those building blocks. By linking different WD documents, the relation between the different XDW documents can be created.

For the correct management of a Tumor Board Review, each of the participants of the Tumor Board must have the possibility to share all relevant medical information. Currently, this is not possible, as there are no standardized means of monitoring and managing the different stages of the workflow, or of the documents that are created and attached in these different Tasks.

The key elements for improvement of the current processes are:

- Managing the TBR workflow
- Tracking the relevant events and related documents
- Tracking the status of each subtask in the workflow
- Access to all relevant images, reports and other documents created in (or used in) the process
- Linking the created documents to the different Tasks in the process, thereby defining the context of these documents.

Problems with the current processes

In the current situation, problems arise at all of the above stages:

1. Request TBR

   Specialists complain about the cumbersome process of gathering the necessary images, reports, and excerpts from their EPR. Currently, texts are faxed (and have to be re-entered into the electronic patient record EPR of the hospital where the TB meeting is held), and images are sent by CD or DVD. The images and reports on these cd’s have to be linked manually to the right patient in the receiving HIS/EPR. This is a time consuming and error-prone process.

2. Schedule TBR

   The chairperson of the Tumor Board has to decide whether the patient fits the constraints for the particular TB meeting, and whether all necessary documents and images are available. If the maximum number of patients has been reached, the chairperson has to determine which patients can be postponed to a later TB meeting. These tasks are time-consuming and often require extra phone calls to the requestor. There is no overview of the status of all requests.

3. Prepare TBR
In the current situation, results from diagnostic studies such as CT scans, X-ray images and endoscopic images can only be seen by the radiologist. Faxes have to be copied if someone wishes to prepare the TB meeting beforehand. In most cases, preparation is not possible for most team members except the radiologist. Also, tracking whether the required documents are available is a time-consuming chore.

4. TBR Meeting

During the TB Meeting, sometimes patients that were scheduled cannot be discussed because DVD’s have not arrived on time, or not at the right address, or have not yet been linked to the patient.

Since the patient come from different hospitals, the medical information is presented in different ways, on different EPR systems. Since most participants have never met the patients they discuss, this can lead to confusion. Also, the notes that are taken during the discussion of a patient can often not be seen or checked by the all participants.

During the TB Meeting, a scribe writes down the findings, conclusions and recommendations for treatment of the patient. These texts have to be checked and validated by the chairperson.

5. Finalize TBR

After the TB meeting, the validated findings, conclusions and recommendations are incorporated into a Tumor Board Review Report. The TBR report is then ready for distribution to the Requestor, and /or other designated healthcare professionals. In the current situation, this is a time consuming process, with manual insertion of the texts into a document that is not automatically created or distributed.

X.2 Workflow Participants and Process Flow

In this section we present the Workflow actors involved in the tumor board process, and we describe in detail process transactions and interactions between them.

A Workflow Participant is an abstraction of systems along with users involved in the tumor board process. They can be identified, based on their roles in the process, as one of five specific participants. Each of these workflow participants has specific rights and duties in the process. They drive the process from one step to another, performing determinate actions on the workflow.

<table>

X.2.1 Use Cases

X.2.1.1 Use Case 1

The following Use Case illustrates the Workflow of a Cross-enterprise Tumor Board Review in a cross-enterprise setting as it is performed in the Netherlands, both in small and academic hospitals. Some parts of the Use case describe new possibilities that the XTB-WD Profile provides, such as the preparation of the case in advance of the actual Tumor Board Meeting.

Request TBR

Dr. Smith, an ENT specialist in hospital A, has a patient with swallowing problems. After physical examination, a MRI of the neck region is performed, and a dense nodule is seen in the esophageal region. Biopsy of the tumor has indicated that the patient has esophageal cancer. In the hospital where Dr. Smith works, there is a protocol that all patients with a diagnosis of esophageal cancer shall be discussed in a weekly Tumor Board Review, which is held in hospital B. This is a multidisciplinary and cross-enterprise meeting, where doctors from the different hospitals in the region discuss the patients. In most cases, there is also an expert physician on the specific type of tumor, who acts as a consultant in difficult cases. This expert is often from an academic hospital.

Schedule TBR

Dr. Smith sends a message to Dr. Kondriakin, the chairperson of the Tumor Board, asking for discussion of his patient at the next Tumor Board meeting. He also sends medical information (images, reports, and a medical summary) that is relevant to the case. In the case of esophageal cancer, often an MRI or a CT-scan, a pathology report, and a short summary of the patient’s case are used.

Dr. Kondriakin, the chairperson of the Tumor Board, receives the request and the medical information, and decides whether the patient meets the inclusion criteria of this particular type or Tumor Board Review. If this is the case, the chairperson sends a Decision Notice to Dr. Smith that his patient will be discussed on the next Tumor Board Review meeting.

Prepare TBR

The radiologist of hospital A has already looked at the MRI of the patient, but in this case, the radiologist of hospital B also will also study them. This ‘second opinion’ is part of the protocol that the hospitals A and B have agreed upon.

<table>
<thead>
<tr>
<th>Workflow Participant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBR Preparator</td>
<td>Any Participant that is part of the Tumor Board, and involved in the review process</td>
</tr>
<tr>
<td>TBR Report Writer</td>
<td>A Participant (usually a Healthcare Professional) who writes down the conclusions of the Tumor Board Review</td>
</tr>
<tr>
<td>TBR Finalizer</td>
<td>A Participant who validates the preliminary Tumor Board Review report</td>
</tr>
</tbody>
</table>
Besides the radiologist, all participants of the Tumor Board (oncologists, case manager, et cetera) in both hospitals have access to the images, reports and request information, at any time and any place. They are also able to comment on the case before the actual Tumor Board Review is being held. This allows for a more efficient processing of the patients at the actual Tumor Board meeting.

**TBR Meeting**

The actual Tumor Board meeting is held from a special room in hospital B, which usually contains a video conferencing system that allows the participants in both hospitals to see and hear each other. On Wednesday afternoon, all participants in both hospital A and hospital B get together in their respective conference rooms, and a video conferencing connection is set up. The case of the patient with esophageal is discussed, and an advice for the optimal treatment methods (surgery, radiotherapy, chemotherapy, or a combination) is written down during the meeting by a scribe.

**Finalize TBR**

This advice is then agreed upon by all members, and incorporated in a Tumor Board Report. The Tumor Board Report is now ready to be sent to Dr. Smith (and to other recipients if so desired) directly after the Tumor Board meeting.

Note 1: The preparation of the TBR Meeting, using a discussion thread is a new feature. Currently, this is not the practice in the Netherlands, but several doctors indicated that this would be a good thing. It would allow them to prepare the ‘easier’ cases, thereby creating more time for the discussion of complicated cases. Also, in very urgent cases, the discussion thread would create a possibility to discuss a patient before the actual (weekly or bi-weekly) TBR Meeting.

Note 2: The above Use Case describes a workflow where two hospitals are involved. However, any number of hospitals or care institutes can be involved in the XTB-WD workflow, including only 1. In this last case, the different tasks in the workflow -Definition are basically the same, although the need for videoconferencing facilities will be less obvious.

**X.2.1.2 Use Case 2**

In this second Use Case, a more basic Workflow of a Cross-enterprise Tumor Board Review is described; this example us from the United Sates. Although this Profile describes a Cross-enterprise process where information is exchanged between different healthcare institutions, Dr. Smith, an ENT specialist in hospital A, has a patient with swallowing problems. After physical examination, a MRI of the neck region is performed, and a dense nodule is seen in the esophageal region. Biopsy of the tumor has indicated that the patient has esophageal cancer. In the hospital where Dr. Smith works, only the more complicated patients with a diagnosis esophageal cancer are discussed in a weekly Tumor Board Review, which is held in hospital B. This is a multidisciplinary and cross-enterprise meeting, where doctors from the different hospitals in the region discuss the patients. In most cases, there is also an expert physician on the specific type of tumor, who acts as a consultant in difficult cases. This expert is often from an academic hospital.
Dr. Smith sends a message to Dr. Kondriakin, the chairperson of the Tumor Board, asking for discussion of his patient at the next Tumor Board meeting. He also sends medical information (images, reports, and a medical summary) that is relevant to the case. This is a meeting where more types of tumor will be discussed.

Dr. Kondriakin, the chairperson of the Tumor Board, receives the request and the medical information, and plans the patient for the Tumor Board Review. He creates a Decision Notice and sends it to Dr. Smith.

All participants of the Tumor Board (oncologists, case manager, et cetera) in both hospitals have access to the images, reports and request information. They are also are able to comment on the case before the actual Tumor Board Review is being held.

The actual Tumor Board meeting is held in a special room in hospital B, which usually contains a video conferencing system that allows the participants in both hospitals to see and hear each other. On Wednesday afternoon, all participants in both hospital A and hospital B get together in their respective conference rooms, and a video conferencing connection is set up. The case of the patient with esophageal is discussed, and an advice for the optimal treatment methods (surgery, radiotherapy, chemotherapy, or a combination) is written down during the meeting by a scribe. This advice is then agreed upon by all members.

The advice document (the Tumor Board Report)

Note: The actual content of the Preliminary_TBR_Report (and of the Tumor_Board_Report) is to be defined by the parties who partake in the Tumor Board Review.

X.2.2 Diagrams

The above Use Case of a typical Tumor Board Review (TBR) process can be described by the following chronological tasks, participants and roles of the participants:

The table below shows each task of the process, the participant involved and the role performed by this participant in the workflow.

<table>

</tbody>
</table>
In an XDW Workflow definition, each Task in the Workflow Definition is accompanied by input- and output documents, as shown in the schema below:

![Workflow Diagram]

**Figure X.2.2-1: XTB-WD Tasks and accompanying Input- and Output Documents**

Note: the names of the Tasks are written ‘Request TBR’ instead of ‘Request TBR’ in these tables (and in Part 2 of this document), because no spaces are allowed in the official names (XML Qnames) of the tasks. This is also the case for the names of the input- and output documents.

In this Workflow Definition, the different Input and Output documents, such as Request_Document, Decision_Notice, or Tumor_Board_Report are not the documents themselves, but labels (placeholders) that describe the function or role of the documents that will be attached in the course of the workflow. In the course of an actual workflow process, links to the actual Input- and Output documents will be added to the Workflow document. The actual documents will be marked with these labels to signify their role in the workflow process. In other words: the content of the different documents is not defined in this Profile; they must be defined by and within the Affinity Domain, as a subset of specification of the workflow definition.

The Tasks of the XTB-WD are explained below:

- **Request_TBR**
  If a patient meets the in- and exclusion criteria of a certain Tumor Board Review, the attending physician may decide to present the case to the Tumor Board for review. The owner of this Task is called the **TBR Requestor**. In this Task, any documents, images or reports that have led to the diagnosis of the patient may be added as Input Documents for this Task. As Output Documents, the TBR Requestor describes the reason for referral to
the Tumor Board Review, and gives a short description of the patient’s case. This
document is labeled Request_Document.

- **Schedule_TBR**
The owner of this Task is called the TBR Scheduler. The TBR Scheduler can be the
chairperson of the TBR, or a medical secretary. The TBR Scheduler reads the request for
admission to the TBR, checks the inclusion- and exclusion criteria for the TBR at hand.
The Scheduler uses the information that has been attached to the first Task for the
assessment, and decides whether, and when, the case will be presented in one of the next
TBR Meetings. The Output Document of this Task is the Decision_Notice, which
describes the decision of the TBR Scheduler if, and when, the patient will be presented.
The Decision_Notice can be sent separately to the requestor. For each requested patient, a
Decision_Notice is created. The Decision Notices can be used to create the work list for
the next Tumor Board Review.

- **Prepare_TBR**
In this phase, all members of the Tumor Board have access to all the images and
documents that have been linked to the TBR workflow so far. This information can be
used to prepare for the actual meeting. In the case where extra input from any of the
members is requested, a second opinion or report may be added to this Task as Output
Document. Also, if someone wishes to pose a question or a remark on the case, he or she
can add this as an Output Documents. This also creates the possibility of a discussion
between the members even before the actual TBR Meeting, to increase the efficiency of
the actual meeting. During the process, a Discussion_Thread document is built up,
containing each of the remarks of the members.

- **TBR_Meeting**
In this stage, all members of the Tumor Board convene and discuss the cases that have
been scheduled, using all relevant information that has been gathered by the team
members. The discussion between members leads to a consensus-based diagnosis, and a
recommendation for the further treatment of the patient. These findings and
recommendations are written down by a scribe, and must be validated by all participants.
This is used as the Output Document of this stage, and is called the
Preliminary_TBR_Report.

- **Finalize_TBR**
In the final phase of the workflow, the Preliminary_TBR_Report is used to create the
Final Tumor_Board_Report, which is the output Document of this Task. This consists of
a document with the relevant patient information, the original request of the Requestor,
and the information of the Preliminary_TBR_Report. The exact content of this report
may vary between the specific Tumor Boards. The finalized Tumor_Board_Report
document can be sent to the designated recipients of the Report, such as the Requestor,
the General Physician of the patient, or any other designated party.
Most types of Tumor Board Review workflow can be described in these five simple Tasks. As is the case with XDW, each Task of the Workflow Definition can be viewed as a black box as far as the execution of the task is concerned.

The Owner of a Task can decide how the task is being performed, as long as the defined output documents are being filled in properly. The difference between a TBR for colon cancer and lung cancer lies in the definition of the content of the input- and output documents that are linked to these Tasks. The actual content of the documents depend on the type of tumor, the agreements between different parties and the technical possibilities to import and export these documents.

Below is a diagram of the process flow of XTB-WD:

![Figure X.2.2.-2: XTB-WD Default Process Flow](image)

Note: Any task in this workflow can be performed in any of the hospitals – basically, this Workflow Definition provides an integration of all participants in one shared workflow.
The following figure is an UML-version of the basic process flow:

![UML-version of the basic process flow](image)

**Figure X.2.2-3: UML-version of the basic process flow**

For the different Tasks in the XTB-WD, the following schema is produced for the different input- and output documents. In practice, the actual documents that accompany the Tasks is different for specific types of Cross-enterprise Tumor Board Reviews – for example, a Tumor Board Review of colon cancer requires different documents than one that focuses on lung cancer. We can, however, describe the type of documents that accompany the different Tasks of the XTB Workflow.

**Table X.2.2-2: Task Status and Accompanying Documents**

### X.2.3 Basic process flow

Below is a schema for the basic process flow of the XTB-WD:

485
X.2.4 Failing Situations

Below is an overview of possible FAILED situations:
During the workflow it is possible that the workflow as described above is aborted due to various reasons, e.g., when insufficient information is available for the preparation, the TBR schedule is overbooked or when the patient has died.

Below is a schema of some possible reasons of failure:

**Table X.2.4-1: Possible Reasons for Failure**

<table>
<thead>
<tr>
<th>Failure of</th>
<th>Reason of failure</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request_TBR</td>
<td>Request is revoked by the requestor</td>
<td>A patient is transferred to another hospital.</td>
</tr>
<tr>
<td>Schedule_TBR</td>
<td>Any reason that a patient cannot be scheduled for a TBR.</td>
<td>It’s not possible to schedule all required specialists.</td>
</tr>
<tr>
<td>Prepare_TBR</td>
<td>Rejection of the preparation by the task owner.</td>
<td>Demise of the patient.</td>
</tr>
</tbody>
</table>
### X.2.5 Options

In this section we describe which variations from the normal process are allowed. It is mandatory for implementers to explicitly define which workflow options, if any, are addressed by their products.

Options that may be selected for this Profile are listed below along with the Workflow Participants to which they apply.

This Workflow Definition Profile is intended to be combined with other IHE Profiles. These other profiles may have their specific options. These are not addressed in this section, which focuses only on the Options identified for this Workflow Definition Profile.

#### X.2.5.1 Workflow Input-and Output

The XTB-WD Profile uses Document Labels to describe the Input- and Output Documents for the different tasks, such as ‘Request_Document’, or ‘Decision_Notice’ or ‘TBR_Report’. This has been done to accommodate for the many different types of Cross-enterprise Tumor Board Meeting. The Input- and Output Document Labels can be seen as placeholders for the actual documents that are going to be attached as the workflow unfolds.

However, within an Affinity Domain, it is possible to define a Workflow definition where actual document templates are linked to the Labels in the template. This can be done by linking a certain type of document (for instance, a CCD of XDS-MS document) to any of the Input- or Output Document Labels.

Below is an example of how this can be implemented.

#### Table X.2.5.1-1: Example of a specific TBR-Workflow Document

<table>
<thead>
<tr>
<th>Actor</th>
<th>Input/Output</th>
<th>Document Placeholder</th>
<th>Optionality</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request_TBR</td>
<td>Input</td>
<td>Clinical_Documents</td>
<td>O</td>
<td>Medical_CCD, Nursing-Summary</td>
</tr>
<tr>

<td>Discussion_Thread</td>
<td>O</td>
<td>TBR-Discussion</td>
</tr>
<tr>
<td>TBR_Meeting</td>
<td>Output</td>
<td>TBR_Report</td>
<td>R</td>
<td>TBR_ColonCa_Report</td>
</tr>
</tbody>
</table>

#### X.3 Workflow Definition Actors and Options

Workflow Participants introduced in Section X.2 are expected to be supported by Workflow Definition Actors that represents abstractions of IT systems. Compliance to this workflow...
definition profile and its options are based on selecting the implementation of one or more of these Workflow Definition Actors.

**X.3.1 Workflow Definition Actors**

Table X.3.1-1 specifies the mapping of Workflow Participants to Workflow Definition Actors.

<table>
<thead>
<tr>
<th>Workflow Participant</th>
<th>Workflow Definition Actor</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBR Requestor</td>
<td>TBR Requestor Actor</td>
</tr>
<tr>
<td>TBR Scheduler</td>
<td>TBR Scheduler Actor</td>
</tr>
<tr>
<td>TBR Preparer</td>
<td>TBR Preparer Actor</td>
</tr>
<tr>
<td>TBR Report Writer</td>
<td>TBR Report Writer Actor</td>
</tr>
<tr>
<td>TBR Finalizer</td>
<td>TBR Finalizer Actor</td>
</tr>
</tbody>
</table>

**X.3.2 Workflow Options**

Table X.3.2-1 specifies the options that are available, if any for each selected Workflow Actors.

<table>
<thead>
<tr>
<th>XTB-WD Workflow Definition Actor</th>
<th>Option</th>
<th>Volume &amp; Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>TBR Requestor Actor</td>

<td>PCC TF-1: X.2.4.1</td>
</tr>
</tbody>
</table>

**X.3.3 Workflow Definition Profile Grouping with other Profiles**

This Workflow Definition Profile is intended to be combined with other IHE Profiles. The profiles that are candidates for such combinations and the associated rules are specified in this Section.
Figure X.3.3-1 presents an overview for the major classes of IHE Profiles that shall or may be grouped:

- The Workflow Definition Profile SHALL be grouped with the XDW Profile.
- The Workflow Definition Profile SHOULD be grouped with one or more Document Content Profiles matched to the input and output reference “Document Labels” in the Workflow Definition Profile (Defined in Vol.2). The Workflow Definition Profile provides only “Document Labels” for these input and output reference documents and not the actual specifications. This selection of the actual document content specification (IHE Content profiles or others), need to be made by the environment that deploys the Workflow Definition Profile.
- The Workflow Definition Profile, the XDW Profile and the selected Document Content Profiles shall be grouped as decided by the deployment environment, with the suitable Integration Profile supporting a document transport service such as XDS for Document Sharing, XDR/XDM for point-to-point directed transport, or other functionally equivalent profiles.

The grouping of XDW actors with each of the XTB-WD workflow definition actors is specified in Table X.3.3-1. These XDW Actors support the creation, consumption and update of the XDW workflow document which is the shared data structure which is tracking the evolution of the workflow. This allows the XTB-WD workflow definition actors, at any point in the workflow to access the most current status of the workflow and share the tasks performed with all other workflow definition actors.

Note: See IHE ITI TF-1: Section 30.3 (XDW Supplement) for other groupings that are needed for the XDW Actors to permit sharing of a Workflow Document with IHE XDS, XDR or XDM Profiles.

Table X.3.3-1: XTB-WD workflow definition actors grouping with XDW Profile Actors

</tr>
<tr>
<td></td>
<td>XDW Content Updater</td>
<td></td>
</tr>
</tbody>
</table>

### X.4 Security Considerations

For this section please see section ITI TF-1: 30.5.
Glossary

Add the following terms to the Glossary:

No new terms.
Volume 2 – Transactions and Content Modules

Y.1 XTB Workflow Definition - XDW Workflow Document – Common Attributes

This workflow definition profile is assigned a specific OID that shall be used to identify the workflowDefinitionReference element of a Workflow Document that tracks an XTB-WD process.

<table>
<thead>
<tr>
<th>type of Workflow</th>
<th>Workflow Definition Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tumor Board Review workflow OID</td>
<td>1.3.6.1.4.1.19376.1.5.3.1.5.3</td>
</tr>
</tbody>
</table>

The XTB-WD Workflow Definition does not introduce new metadata and all the metadata elements used are the common XDS document metadata specified in ITI TF-3:4.1.5 and in ITI TF-3:5.4.6. In this section only the use of some specific metadata for the use of XDW in the XTB-WD context is specified.

<table>
<thead>
<tr>
<th>XDS Metadata Attribute</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>typeCode</td>
<td>For the Workflow Document which tracks the XTB-WD process the code for the typeCode shall be: XX_TB-WD (still to be decided by LOINC)</td>
</tr>
<tr>
<td>classCode</td>
<td>For the Workflow Document which tracks the XTB-WD process the code for the classCode is defined by the XDW Profile. the ClassCode shall be: as specified in the XDW Profile</td>
</tr>
</tbody>
</table>
| eventCodeList          | **Rule 1:** An XTB-WD workflow shall be created with code OPEN and shall remain in this status until it is set to CLOSED.  
**Rule 2:** An XTB-WD workflow should be set to CLOSED when:  
- one of the tasks has the status FAILED; or  
- when you complete the workflow with the Finalize TBR task in status COMPLETED.  
See ITI TF-3: 5.4.5.7 for a general description of this attribute. |
| serviceStartTime       | It is the time at which work began on the first task for this workflow. |
| serviceStopTime        | It is the time at which the status of the overall Workflow is changed from OPEN to CLOSED.  
It shall be empty when the workflow is still in OPEN state. |
Y.2 XDW Workflow Content Modules

The main instrument of the Cross-enterprise Tumor Board Workflow Definition Profile is the Workflow Document defined in the XDW Profile. This document does not include clinical information about the patient directly. It shall only contain information necessary for organizing and defining work tasks. All clinical information regarding any task shall be provided through separate documents that are referenced from the associated input or output documents.

Detailed knowledge of the Cross-enterprise Document Workflow (XDW) Profile is indispensable in understanding the following sections. For more detailed, refer to ITI TF-3: 5.4.

Y.3 Task Specifications

In the WS-Human Task specification, these are the allowed Task statuses:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATED</td>
<td>The Task is defined, but not active (yet)</td>
</tr>
<tr>
<td>READY</td>
<td>The Task is ready to be picked up by an owner</td>
</tr>
<tr>
<td>RESERVED</td>
<td>(not used in this profile)</td>
</tr>
<tr>
<td>IN_PROGRESS</td>
<td>The Task has been picked up by an owner, but has not been finished yet</td>
</tr>
<tr>
<td>SUSPENDED</td>
<td>(not used in this profile)</td>
</tr>
<tr>
<td>COMPLETED</td>
<td>The Task has been performed</td>
</tr>
<tr>
<td>FAILED</td>
<td>The Task has failed</td>
</tr>
<tr>
<td>ERROR</td>
<td>(not used in this profile)</td>
</tr>
<tr>
<td>EXITED</td>
<td>(not used in this profile)</td>
</tr>
<tr>
<td>OBSOLETE</td>
<td>(not used in this profile)</td>
</tr>
</tbody>
</table>

In the XTB-WD Profile, the following statuses are used: CREATED, READY, IN_PROGRESS, COMPLETED and FAILED. The role of the different statuses is explained below.

Status CREATED

In order to see the different tasks in a care pathway, including the ones that are in the future, some (or all) of the tasks in a workflow definition can be present at the beginning of the workflow. The tasks that are in the future can be given the status ‘CREATED’, which means that the workflow is defined, but has not started yet.

Status READY

When a Task has been completed by a Task Owner, he/she can update the XDW-document in the following manner: the status of the current Task is set to COMPLETED, and the status of the next Task is set to READY. This status can be used as a trigger for the Owner of the next Task. When the Owner of the next Task picks up the Task, the status of that Task can be switched to IN_PROGRESS.
Status COMPLETED

The Owner of a certain Task has finished the Task. If there are Required Output Documents; these should be present. If there is a validation system in place, the COMPLETED status can act as a trigger to validate that the Task fulfills the requirements of that Task.

Status FAILED

This status is used to indicate that a Task has not been performed. This status can be used to show where a workflow has been stopped.

Below are the specifications of the Tasks and their possible task statuses in the XTB-WD Profile:

Table Y.3-1: Cross-enterprise Tumor Board Workflow Definition Task Specifications

<table>
<thead>
<tr>
<th>Task Type</th>
<th>Requirement For task initiation</th>
<th>Task Statuses *valid when task initiated</th>

<td>Tumor_Board_Report</td>
<td>R</td>
</tr>
</tbody>
</table>
In this section we define rules and constraints for the creation of the XDW Workflow Document related to the Tumor Board Review process. These rules are necessary to manage transition between tasks. For each task are defined:

- The task attributes: ID, name, type description;
- The sequence of the tasks: the previous and the next task;
- Who is allowed to create each task and to change the status;
- The task event;
- The input and output documents.

The rules in the workflow definition ensure that the different participants in a workflow operate jointly to advance within tasks and to move from one task to another in a consistent way.

**Y.3.1 Task: Request_TBR**

**Table Y.3.1-1: Request_TBR Task Rules**

<table>
<thead>
<tr>
<th>Task attributes</th>
<th>Rules for the task “Request_TBR”</th>

**owner**<br>Chairman of the TBR.

**Owner changes**<br>No

**<taskEvent>**<br>At least one

**Task Removal Allowed**<br>No

**Task Duplication**<br>No

---

**Y.4 Input- and output documents**

The WS-Human Task element that permits to store the reference of an object in input or output sections is described in IHE ITI TF-3:5.4.3

In Table Y.4-1 we define the kind of document involved in the tumor board process. For each type of document, this table defines the Documents Labels of the document. This Label describes the function or the role that the document performs in the course of the process or during the execution of a task, and defines the type of information conveyed and expected by the owner of the task.
Table Y.4-1: Document Labels involved in the XTB-WD process

<table>
<thead>
<tr>
<th>Document Label</th>
<th>Examples of actual document</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clinical Documents</td>
<td>CCD / XDS-MS, X-thorax, Pathology report</td>
