Implementation and Final Text versions and [here](#) for Public Comment versions.

Foreword

This is a supplement to the IHE Quality, Research and Public Health (QRPH) Technical Framework V0.1. Each supplement undergoes a process of public comment and trial implementation before being incorporated into the volumes of the Technical Frameworks.

This supplement is published on August 27, 2015 for trial implementation and may be available for testing at subsequent IHE Connectathons. The supplement may be amended based on the results of testing. Following successful testing it will be incorporated into the Quality, Research and Public Health Technical Framework. Comments are invited and can be submitted at http://www.ihe.net/QRPH_Public_Comments.

This supplement describes changes to the existing technical framework documents.

“Boxed” instructions like the sample below indicate to the Volume Editor how to integrate the relevant section(s) into the relevant Technical Framework volume.

40 ***Amend Section X.X by the following:***

Where the amendment adds text, make the added text **bold underline**. Where the amendment removes text, make the removed text **bold strikethrough**. When entire new sections are added, introduce with editor’s instructions to “add new text” or similar, which for readability are not bolded or underlined.

125 **Introduction to this Supplement**

The Aggregate Data Exchange (ADX) Profile defines the structure of ADX/XML messages to be exchanged between a Content Creator and a Content Consumer. ADX introduces a new actor: the Content Data Structure Creator. The Content Data Structure Creator defines the structural metadata (e.g., code lists for dataElements) to be used in the message exchange. The message structure definition files created by the Content Data Structure Creator may be employed by a Content Creator to construct and exchange interoperable, ADX-conformant messages with a Content Consumer.

130 The ADX Profile has been developed to support interoperable public health reporting of aggregate health data. The need for this profile arises from the fact that data is currently being exchanged using a variety of formats which are not formally described. The aim of ADX is to describe the development of lightweight, formal message structures which meet the requirements of the use cases in context.

135 140 This specification profiles an SDMX v2.1 Data Structure Definition (DSD) to normatively describe the structure of routine aggregate data reports as XML. This is a message structure profile; specification of the message transmission is out of scope. Because of this, actor groupings are not defined.

Open Issues and Questions

There is some overlap in the aims with QRDA. We need to justify and explain.

Closed Issues

145 Maybe we have to create new actors if Content Creator/Content Consumer do not fit.
RESOLUTION: A new actor has been defined: the Content Data Structure Creator.

Placing dimensions at the dataset or data row level requires further discussion.

RESOLUTION: For ADX mandatory dimensions, orgUnits and period dimensions shall be placed at the dataset level and dataElement dimension shall be placed at the data row level.

150 CSV format may be considered too low a bar for profiling. It should not be at the same conformance level as the other two.

RESOLUTION: CSV format has been dropped from the profile.

SDMX v2.1 describes and xml and CSV rendition of the data. It doesn't currently describe a json rendition. There is considerable pressure from implementers to support json. Should we incorporate a mapping in an informative appendix?

RESOLUTION: Only XML formats are normatively defined.

SDMX 2.0 vs 2.1: version 2.0 is the most widely adopted version of SDMX, but it is 2.1 which is published by ISO. V2.0 is published by the SDMX consortium.

RESOLUTION: Because it is the version balloted by ISO, ADX profiles SDMX v2.1.

160

General Introduction

Update the following appendices to the General Introduction as indicated below. Note that these are not appendices to Volume 1.

Appendix A – Actor Summary Definitions

165 *Add the following actors to the IHE Technical Frameworks General Introduction list of actors:*

| Actor | Definition |
|--------------------------------|--|
| Content Data Structure Creator | The Content Data Structure Creator creates a message structure definition that may be employed by a Content Creator to develop profile-conformant messages for exchange with a Content Consumer. |

Appendix B – Transaction Summary Definitions

Add the following transactions to the IHE Technical Frameworks General Introduction list of Transactions:

170 No new transactions.

Glossary

Add the following glossary terms to the IHE Technical Frameworks General Introduction Glossary:

No new glossary terms.

185 **X Aggregate Data Exchange (ADX) Profile**

The Aggregate Data Exchange (ADX) Profile enables interoperable public health reporting of aggregate health data. ADX will typically be used to represent routinely reported aggregate data such as the numerators and denominators which can be used in the construction of public health indicators.

190 The central concern of an ADX is the reporting of data tuples. These tuples are sets of values which are keyed according to a dataElement subject, a temporal dimension, and a spatial dimension. An example data tuple is the number of live births recorded in January 2015 at Nyamandhlovu Clinic.

195 Aggregate health dataElements are defined in an implementing jurisdiction, e.g., a single health facility or a geographic/administrative area such as district, province or country, and are currently being exchanged using a variety of ad-hoc and application-specific formats which are not formally described.

200 ADX defines a Content Data Structure Creator Actor that creates two message structures that enable an implementing jurisdiction to formally define the aggregate health data to be exchanged:

1. ADX profiles the SDMX v2.1 Data Structure Definition (DSD) specification
2. ADX normatively describes how a DSD file is transformed to develop an XML schema definition (XSD) file

205 The DSD and XSD describe lightweight, formal XML messages containing aggregate health data that meet the requirements of the use cases in the implementing jurisdiction.

ADX Content Creator and Creator and Consumer Actors use the DSD and XSD to construct and exchange ADX/XML messages containing aggregate health data in their jurisdiction.

210 The ADX Profile contains few constraints regarding the nature and source of coding systems, and there are liberal extension points intended to allow ADX content to be embedded within different envelopes and its message attributes extended in locally-meaningful ways.

In summary:

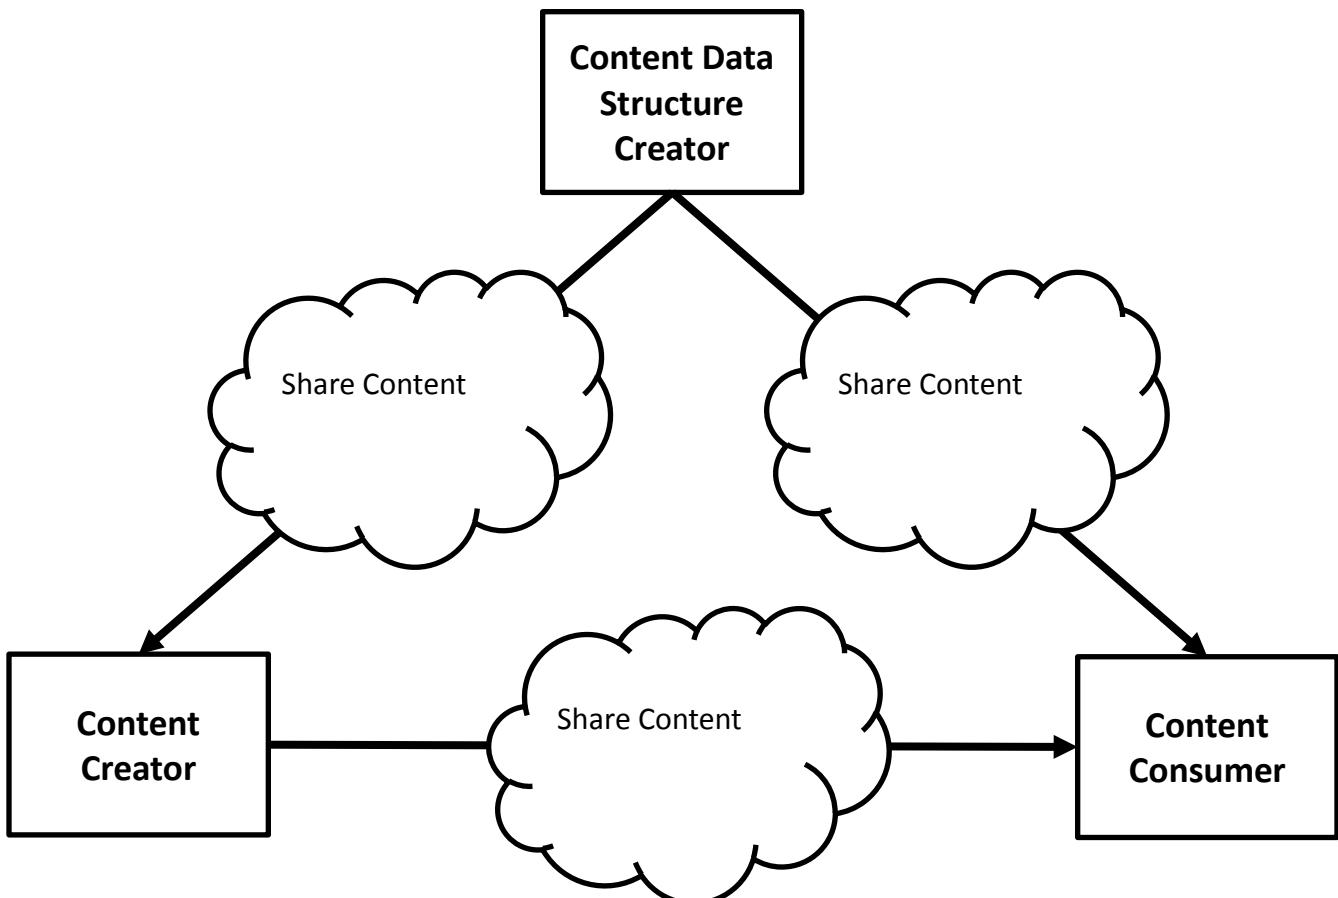

- The ADX Profile defines the process for a Content Data Structure Creator to develop an SDMX-conformant DSD which describes the base constraints for a valid ADX XML data message. Individual jurisdictions will extend the DSD by specifying relevant codelists and additional dimensions of data to satisfy their message exchange use cases.
- The ADX Content Data Structure Creator transforms the resulting DSD into an XML schema definition (XSD) file.
- An ADX Content Creator and Content Consumer then exchange ADX-conformant XML messages that are conformant with the structure described by the ADX-conformant XSD and DSD files.

The method of exchange between a Content Creator and a Content Consumer of ADX-conformant XML messages is not constrained by this profile (e.g., an implementing jurisdiction may choose to use SMS for Content Creators and Content Consumers to exchange ADX/XML containing their aggregate health data).

225 **X.1 ADX Actors, Transactions, and Content Modules**

This section defines the actors, transactions, and/or content modules in this profile. General definitions of actors are given in the Technical Frameworks General Introduction Appendix A at http://ihe.net/Technical_Frameworks.

230 Figure X.1-1 shows the actors directly involved in the ADX Profile and the direction that the content is exchanged. Although the Content Creator employs the message structure definition files that result from a Content Data Structure Creator, there is not a message exchange transaction, per se, between these actors.

235 **Figure X.1-1: ADX Actor Diagram**

Table X.1-1 lists the content module(s) defined in the ADX Profile. To claim support for this profile, an actor shall support all required content modules (labeled “R”) and may support optional content modules (labeled “O”).

240

Table X.1-1: ADX Profile - Actors and Content Modules

| Actors | Content Modules | Optionality | Reference |
|--------------------------------|-----------------|-------------|-------------------------------------|
| Content Data Structure Creator | ADX/DSD | R | QRPH TF-3: Sec 8.2-8.3, App. 8A, 8E |
| | ADX/XSD | R | QRPH TF-3: Sec 8.2-8-3, App. 8B, 8F |
| Content Creator | ADX/XML | R | QRPH TF-3: App 8G |
| Content Consumer | ADX/XML | R | QRPH TF-3: App 8G |

X.1.1 Actor Descriptions and Actor Profile Requirements

X.1.1.1 Content Data Structure Creator

245 A Content Data Structure Creator defines the structure of XML data to be exchanged between a Content Creator and Content Consumer. Typically, the Content Data Structure Creator will be an implementing jurisdiction such as a ministry of health, a global non-government organization (NGO) or a donor.

A Content Data Structure Creator shall create two normative message structure definition files.

- 250
1. an SDMX v2.1-conformant Data Structure Definition (DSD) file conformant to the normative ADX schematron specification (see QRPH TF-3: 8.2 and Appendix 8A)
 2. a W3C-conformant XML Schema Definition (XSD) file matching the result generated by the normative XSLT transform from DSD to XSD (see QRPH TF-3: 8.3 and Appendix 8B).

255 Informative examples of the DSD and XSD are included in QRPH TF-3: Appendices 8E and 8F.

X.1.1.2 Content Creator

A Content Creator shall be able to generate an XML file that is conformant to the schema defined by the DSD and XSD files produced by the Content Data Structure Creator.

X.1.1.3 Content Consumer

260 A Content Consumer shall be able to process an XML file that is conformant to the schema defined by the DSD and XSD files produced by the Content Data Structure Creator and persist it in such a way that each tuple of the XML file may be individually accessed.

X.2 ADX Actor Options

265

Table X.2-1: ADX - Actors and Options

| Actor | Option Name | Reference |
|--------------------------------|--------------------|-----------|
| Content Data Structure Creator | No options defined | -- |
| Content Creator | No options defined | -- |
| Content Consumer | No options defined | -- |

X.3 ADX Required Actor Groupings

There are no Required Actor Groupings defined.

X.4 ADX Overview

270 ADX defines the normative process used to develop a simple message structure for representing aggregate health data.

The ADX message structure is defined using a Data Structure Definition (DSD) file conformant to the Statistical Data and Metadata Exchange (SDMX v2.1) specification. SDMX v2.1 is defined in ISO 17639:2013(E). ADX profiles this ISO standard; it constrains the SDMX

275 specification and articulates how an ADX-conformant DSD is developed. The XML schema definition (XSD) for exchanged messages is generated from the DSD via a normative transformation.

280 This profile sets constraints on the mandatory dimensions which shall be in a DSD. Additional data element dimensions may be defined as necessary within the context of use - for example, within a particular country or implementing jurisdiction. Similarly, whereas ADX assumes that codelists and other structural metadata will be exchanged between Content Creators and Content Consumers, the content of that structural metadata is out of scope for ADX and shall be defined by the jurisdictional bodies governing the data exchange. These inputs to the ADX message schema definition are conceptually illustrated by Figure X.4-1.

285

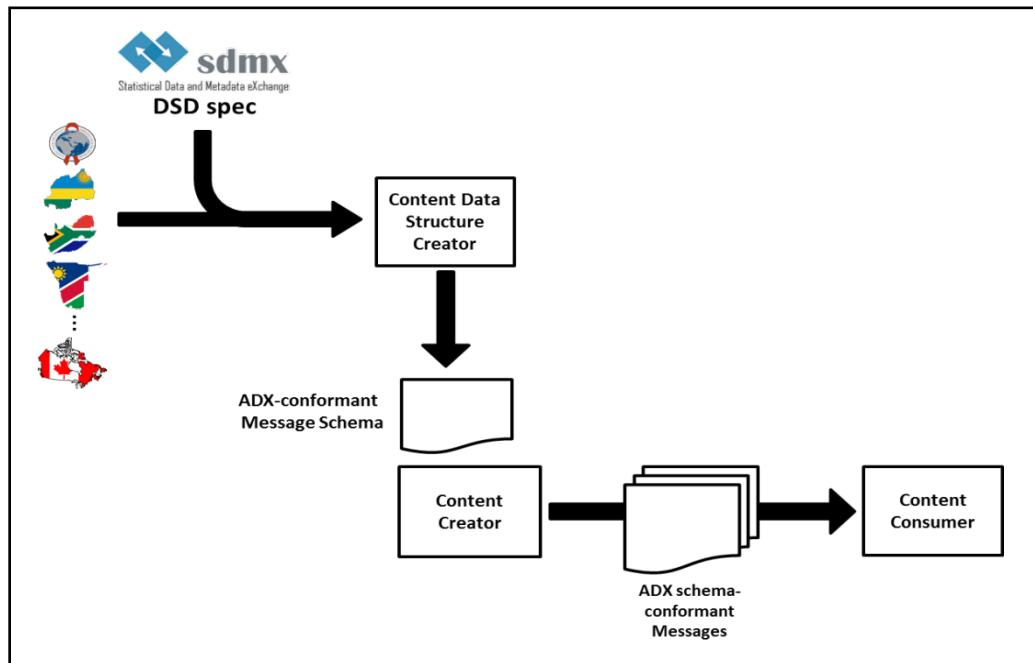

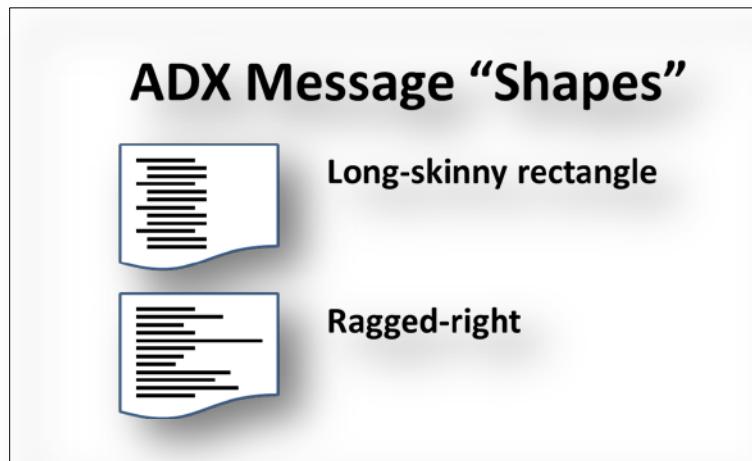

Figure X.4-1: An illustration of ADX Profile inputs and outputs

- 290 The shape of aggregate data reports can be different, as illustrated in the use cases in Section X.4.2. In some cases the data is “rectangular” (all data rows share the same dimensionality). In other cases, where the electronic data must model a complex paper form (for example), some dataElements are disaggregated differently from others, leading to a “ragged-right” shape. Rectangular datasets are shaped “long and skinny”; for each combination of organization unit (typically a “facility”) and time period, there will be a list of data element and value pairs. Ragged-right messages, on the other hand, may have tuples of differing widths depending on whether disaggregation attributes have been specified for the data element (e.g., number of malaria cases, disaggregated by gender and by age range). These two characteristic message shapes are illustrated in Figure X.4-2.
- 295
- 300

305

Figure X.4-2: ADX Message Shapes

In summary:

- The ADX Profile defines the process for a Content Data Structure Creator to develop an SDMX-conformant DSD which describes the base constraints for a valid ADX XML data message. See QRPH TF-3: 8.2
- Individual jurisdictions will extend the DSD by specifying relevant codelists and additional dimensions of data to satisfy their message exchange use cases.
- The ADX Content Data Structure Creator transforms the resulting DSD into an XML schema definition (XSD) file. See QRPH TF-3: 8.3
- An ADX Content Creator and Content Consumer then exchange ADX-conformant XML messages that are conformant with the structure described by the ADX-conformant XSD and DSD files.

X.4.1 Concepts

The following concepts are used in this profile:

- 320 **Data Structure Definition (DSD):** a formal SDMX v2.1 definition of the structural metadata of an ADX message.
- Data value:** a reported value with its associated keys
- Data Value Set:** a collection of data values conforming to the ADX DSD.
- 325 **Data element:** the atomic subject of data collection such as “number of bed nets distributed”, “number of confirmed malaria cases”, “number of midwives”. This concept is required for the construction of public health indicators, but is not in itself an indicator.

330 **Organization Unit:** the spatial dimension of the data value tuple. It can identify a single health facility or a geographic/administrative area such as district, province or country. Within a national reporting structure, an organization unit represents a single node in a reporting hierarchy.

Time: the temporal dimension of the data value tuple. For routine data this would represent a time period such as the month of January 2015, the ISO8601 week number 3 of 2015, or the year 2015.

Value: the recorded value which is keyed in the data value tuple.

335 **X.4.2 Use Cases**

X.4.2.1 Use Case #1: Community health workers filing routine reports

X.4.2.1.1 Community health workers filing routine reports: Use Case Description

340 An Auxiliary Nurse Midwife (ANM) in an Indian state uses a simple SMS message to report 40 simple aggregate data elements. These are reported monthly and some of the more critical ones also daily. For example

- Number of ANY new cases registered
- Number of children given full immunization

345 These are all related to mother and child health services provided by the sub center and either in her clinic or outreach. She would take these numbers from her register. The data elements are all simple without further disaggregation.

350 The SMS message is sent to a gateway system, which (today) pushes the aggregate data report into the state level Health Management Information System (HMIS) system using a proprietary format. In the future state, the ADX Content Data Structure Creator defines the structure of the mother and child data to be exchanged, and the gateway system acts as an ADX Content Creator to produce these reports in a format which can be readily consumed by an ADX Content Consumer.

For ADX messages sent from the gateway that relate to a particular ANM for a particular time period, this message exchange would be a potential example of the “long skinny” rectangular shape.

355 **X.4.2.2 Use Case #2: Reporting health worker data**

X.4.2.2.1 Reporting health worker data Use Case Description

360 In Sierra Leone the two systems central to the management of the health system are the national HMIS and the human resource system, or health worker registry (HWR). A routine human resource report is reported by the health facility every six months. The reports consist of counts of health worker cadre's working at the facility (number of doctors, nurses, community health

workers etc.). There is an additional disaggregation on all report rows which indicates the salaried status of the employee.

365 This data could instead be extracted directly from the health worker registry and represented as an ADX summary report to be consumed by the national HMIS. The benefits of doing this can be either to reduce the reporting burden at the facility by replacing the manual data entry or to supplement it by acting as a control to detect staffing anomalies. The report extracted from the health worker registry would contain data for a single time period but for multiple health facilities.

370 In this use case, the ADX Content Data Structure Creator defines the structure of the human resource report, the health worker registry acts as an ADX Content Creator, and the national HMIS is a Content Consumer.

X.4.2.3 Use Case #3: Routine reporting from EMR

This use of ADX enables generation and reporting of aggregate data from EMRs to HMIS without the need for double data entry by facility staff in both systems.

375 **X.4.2.3.1 Routine reporting from EMR: Use Case Description**

380 In the majority of countries, routine health facility reports are compiled manually at the facility from paper registers and tally sheets. To deal with the challenge of continuity of care, the antiretroviral therapy (ART) treatment center of a health facility has acquired an EMR system to manage patients. The routine ART reports demanded of the facility are complex, so there are considerable benefits in terms of reducing reporting burden as well as increasing accuracy to extracting reports from the EMR.

Current state

385 In the current state, aggregate data from a facility EMR is generated as a printed report and sent to a district office. Here, this aggregate data is hand-entered into the district health information system (DHIS), which feeds the national HMIS. This workflow is illustrated by Figure X.4.2.3.1-1.

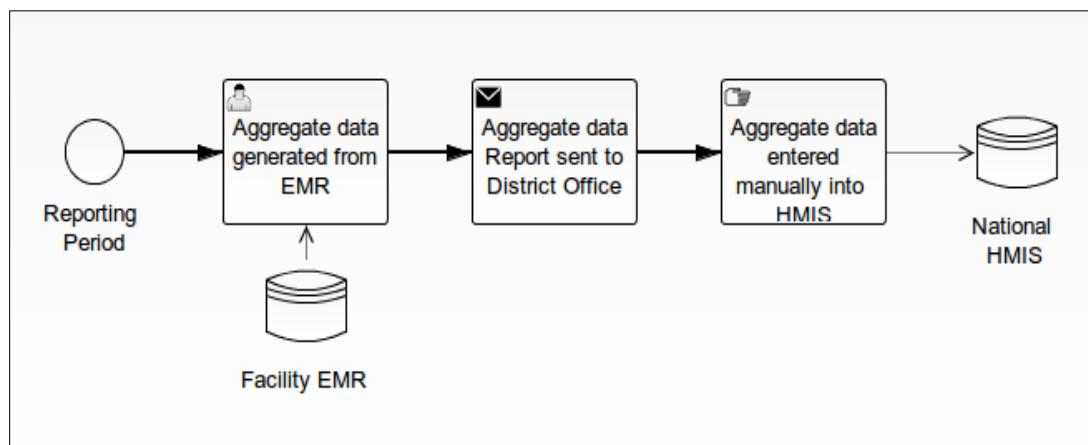

Figure X.4.2.3.1-1: Current state of EMR to HMIS data exchange

390 Desired state

The desired state is illustrated by Figure X.4.2.3.1-2. In the desired state, data from the facility EMR is used to generate an ADX-conformant message. The ADX-conformant message is sent by the facility EMR (acting as a Content Creator) to the DHIS (acting as a Content Consumer). Such a message exchange improves the timeliness and efficiency of the HMIS data reporting workflow.

395

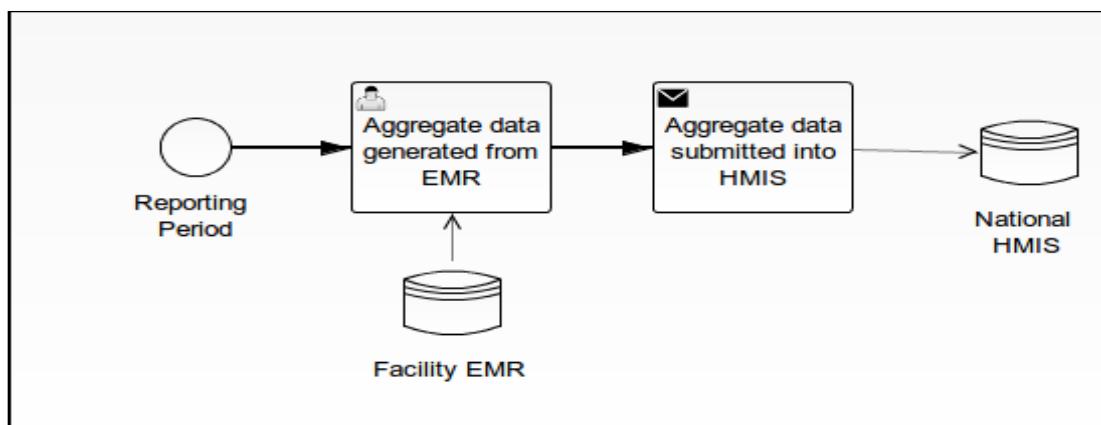

Figure X.4.2.3.1-2: Desired state of EMR to HMIS data exchange

400 The ADX Content Data Structure Creator models the facility monthly reports off the paper reporting form and consists of a set of dataelements which form a logical set but are disaggregated differently. For example the number of ART stage 1 new enrollment is disaggregated by three age groups and by gender, whereas the number of patients on particular first line regimens is collected as simple counts without further disaggregation. The ART

- 405 monthly summary report from the facility will then consist of data which is not neatly rectangular in terms of dimensions, but will instead be an example of the “ragged-right” ADX message shape.

X.4.2.4 Use Case #4: Reporting data from HMIS to Other Aggregate Data Repositories

- 410 This use case describes ADX enabling the reporting of aggregate data from a national HMIS and consumed by other aggregate data repositories used for global reporting.

X.4.2.4.1 Reporting national data from HMIS: Use Case Description

- To facilitate Indicator reporting, country offices may generate aggregate data from national HMIS for submission to funding agencies. In this case the national HMIS is the ADX Content 415 Data Structure Creator and Content Creator. This data can be consumed by other aggregate data repositories, such as UNAIDS Global AIDS Response Progress Reporting (GARPR) online tool and PEPFAR information system, Data for Accountability, Transparency and Impact (DATIM), for monitoring health goals. As in the previous use case, the reported data will have a ragged disaggregation dimensionality.

420

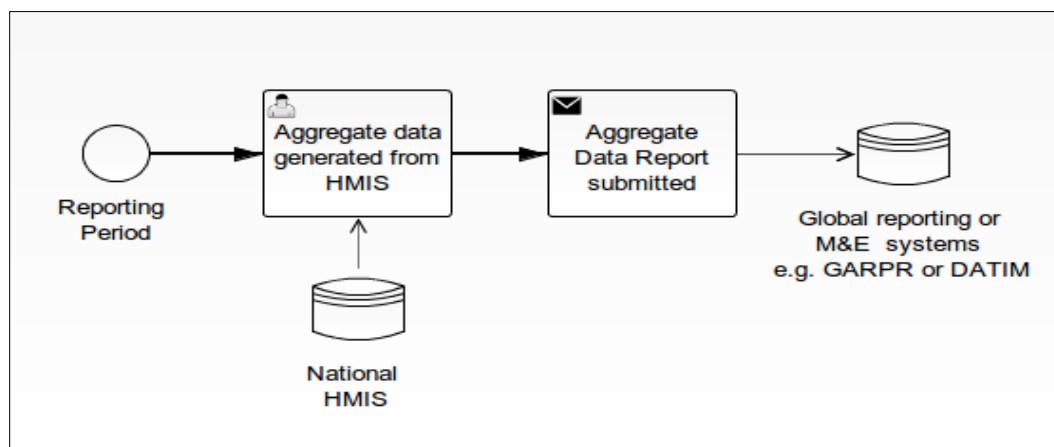

Figure X.4.2.4.1-1 – Global reporting to M&E Systems (e.g., DATIM)

X.5 ADX Security Considerations

- 425 The ADX Profile does not support the exchange of person-centric health information. Therefore, this profile does not specify security mechanisms, such as the ITI Audit Trail and Node Authentication (ATNA) Profile, that would be required were that the case. Implementers should nevertheless be sensitive to the possibility of approximate personal identification arising from aggregate data derived from small population sets. Transport of such data should be safeguarded 430 according to jurisdictional guidelines.

X.6 ADX Cross Profile Considerations

There are no Cross Profile considerations.

8 ADX Content Modules

This section defines Content Modules for the Aggregate Data Exchange (ADX) Profile.

460 **8.1 Overview of ADX process**

A Content Data Structure Creator creates ADX-conformant DSD and XSD files. Typically, the ADX Content Data Structure Creator will be an implementing jurisdiction such as a ministry of health, a global non-government organization (NGO) or a donor.

- 465
- An ADX compliant DSD is a profile of the SDMX 2.1 DSD, as described in Section 8.2 and formally expressed as a Schematron rule set in Appendix 8A.
 - An ADX compliant schema is one that can be derived from an ADX compliant Data Structure Definition (DSD), as described in Section 8.3. The generation of an ADX schema from an ADX DSD makes use of a normative XSLT stylesheet provided in Appendix 8B. A sample ADX compliant schema is provided in the informative Appendix 470 8F.

Content Creators and Content Consumers use the DSD and XDS and exchange a data payload that conforms to an ADX compliant W3C XML schema. A sample ADX compliant data payload is provided in the informative Appendix 8G.

475 Additional (informative) message constraints for interoperability of ADX data exchange which are outside of the scope of this profile are described in Section 8.4.

8.2 The Data Structure Definition (DSD)

An ADX compliant DSD shall be all of:

- i. a well-formed XML 1.0 document;
- ii. a valid SDMX 2.1 mes:Structure message;
- iii. compliant with the additional constraints defined below.

480

The purpose of profiling the base DSD is to provide guidance regarding which parts of an ADX DSD are fixed by the profile and which parts may be extended to support implementation-specific requirements.

8.2.1 ADX DSD constraints

485

A Schematron (ISO/IEC 19757-3:2006) schema is provided in Appendix 8A which provides a formal means of validating ADX DSD documents. This Section 8.2.1 provides a description of the constraints within the Schematron schema. In the event of disagreement or ambiguity between the textual and the schema, the Schematron shall be considered normative.

8.2.1.1 Top level structure

490 The root element of an ADX DSD document shall be a `mes:Structure` element.

The root element shall have a single `mes:Structures` child element.

The `mes:Structures` element shall have the following three child elements:

| Element | Description |
|---------------------------------|--|
| <code>str:Codelists</code> | Defines sets of data values that are allowed when a data dimension or attribute is constrained to an element within a set. |
| <code>str:Concepts</code> | Used to produce the dimension attribute names in an ADX data message. |
| <code>str:DataStructures</code> | Specifies the dimensions and attributes of the data including their syntax, tying them to Codelists and Concepts. |

495 Note: ADX does not preclude the Content Data Structure Creator from including other SDMX elements in the structure message. Elements that are not prescribed in this specification may be ignored by the XSLT transform when generating an ADX schema.

500 Central to the governance of SDMX structure definitions is the notion of Agency. Each structure element (e.g., Codelist, ConceptScheme, DataStructure) has a maintenance agency identifier associated with it. ADX defines one agency identifier, '`IHE_QRPH`', which is the maintenance agency for the mandatory concept scheme listed in Appendix 8D. A Content Data Structure Creator which is defining an ADX conformant DSD shall make use of an agency identifier which indicates that it is the maintenance authority for those structures which extend the mandatory ADX-defined structures.

505 The illustrative sample DSD in appendix 8E assumes a hypothetical use case where the West African Health Organisation uses the identifier '`WAHO`' to define a DSD.

8.2.1.2 Codelists

The `str:Codelists` element may have any number of `str:Codelist` child elements.

510 The ADX Profile does not specify the content of code lists; these are specified by the implementing jurisdiction and used by the Content Data Structure Creator. The code lists used for controlling vocabulary of dimensions shall be provided within the DSD in SDMX v2.1 compatible format. The following example, Figure 8.2.1.2-1, shows a hypothetical code list for the West Africa Health Organisation to represent data elements:

```
515 <str:Codelists>
<str:Codelist id="CL_DataElements" agencyID="WAHO" version="1.0">
<com:Name xml:lang="en">West Africa Health Organisation Data elements</com:Name>
<str:Code id="MAL01">
<str:Name xml:lang="en">Confirmed Malaria cases</str:Name>
</str:Code>
```

525

```
<str:Code id="MAL02">
<str:Name xml:lang="en">Unconfirmed Malaria cases</str:Name>
</str:Code>
<str:Code id="MAL03">
<str:Name xml:lang="en">Malaria deaths</str:Name>
</str:Code>
</str:Codelist>
...
</str:Codelists>
```

530

Figure 8.2.1.2-1: DSD Codelist example

The full example in Appendix 8C shows additional Codelists for orgUnits, Age Group and Sex representation.

8.2.1.3 Concepts

535

The str:Concepts element shall have one or more str:ConceptScheme child elements. One of these str:ConceptScheme elements shall have an @id attribute of ADX_MANDATORY_CONCEPTS and @agencyID attribute of IHE_QRPH.

540

The mandatory str:ConceptScheme is shown in Figure 8.2.1.3-1. A Content Data Structure Creator shall not make any changes to the content of the mandatory str:ConceptScheme elements.

545

```
<str:ConceptSchemeid="ADX_MANDATORY_CONCEPTS" agencyID="IHE_QRPH"version="1.0"
isFinal="true">
<com:Name xml:lang="en">Mandatory concepts defined by IHE ADX profile</com:Name>
<str:Concept id="dataElement" >
<com:Name xml:lang="en">Subject of data measure</com:Name>
</str:Concept>
<str:Concept id="orgUnit" >
<com:Name xml:lang="en">Spatial dimension of measure</com:Name>
</str:Concept>
<str:Concept id="period" >
<com:Name xml:lang="en">The temporal dimension of the measure</com:Name>
</str:Concept>
<str:Concept id="value" >
<com:Name xml:lang="en">Observed measure value</com:Name>
<str:CoreRepresentation>
<str:TextFormat textType="Decimal" />
</str:CoreRepresentation>
</str:Concept>
</str:ConceptScheme>
```

550

555

560

Figure 8.2.1.3-1: DSD mandatory ConceptScheme

565 Note that the value concept is the only concept which provides a core representation in the mandatory concept scheme. The enumerated code list representation for orgUnit and dataElement shall be provided as a str:LocalRepresentation of the str:Dimension as described below.

A Content Data Structure Creator may provide this concept scheme inline in the DSD content, though it is recommended that it refer to it with an external reference such as in Figure 8.2.1.3-2:

570

```
<str:ConceptScheme id="ADX_MANDATORY_CONCEPTS" agencyID="IHE_QRPH" version="1.0"
    isExternalReference="true" structureURL="qrph_structures.xml">
<com:Name xml:lang="en">Mandatory concepts defined by IHE ADX profile</com:Name>
</str:ConceptScheme>
```

Figure 8.2.1.3-2: External reference to ConceptScheme

575

Content Data Structure Creators may provide additional str:ConceptScheme elements to meet requirements of additional disaggregation. Figure 8.2.1.3-3 shows an example of one concept within an implementation-defined concept scheme:

580

```
<str:ConceptScheme id="ADX_WAHO_CONCEPTS" agencyID="WAHO" version="1.0">
<com:Name xml:lang="en">Disaggregation concepts used in West Africa Health
    Organisation data warehouse</com:Name>
<str:Concept id="AGE_GROUP" >
<com:Name xml:lang="en">Age group</com:Name>
<str:CoreRepresentation>
<str:Enumeration>
<Ref agencyID="WAHO" id="CL_AgeGroup" version="1.0"/>
</str:Enumeration>
</str:CoreRepresentation>
</str:Concept>
...
</str:ConceptScheme>
```

585

590

Figure 8.2.1.3-3: DSD Implementation ConceptScheme example

595 Note that concept schemes other than the mandatory concept scheme may, and should where possible, provide a str:CoreRepresentation which refers to a str:Codelist within the DSD. Where this is not possible (for example if the Content Data Structure Creator is not the maintenance Agency for the str:ConceptScheme), then the representation shall be provided as a str:LocalRepresentation of the str:Dimension as described in Section 8.2.1.4.1.

600 **8.2.1.4 DataStructures**

The str:DataStructures element defines the format of the data dimensions and ties them to concepts and codelists. SDMX v2.1 DSD allows the str:DataStructures element to have

any number of child `str:DataStructure` elements, however the ADX Profile specifies that there will be exactly one.

605

```
<str:DataStructures>
<str:DataStructure id="MALARIA" agencyID="WAHO" version="1.0">
    <com:Name xml:lang="en">ADX data structure</com:Name>
    <str:DataStructureComponents>
        <str:DimensionList> ... </str:DimensionList>
        <str:Group id="OUTER_DIMENSIONS"> ... </str:Group>
        <str:MeasureList> ... </str:MeasureList>
    </str:DataStructureComponents>
</str:DataStructure>
</str:DataStructures>
```

610

615

Figure 8.2.1.4-1: DataStructure example

620

SDMX allows for the definition of `str:Attributes` in addition to `str:Dimensions`. The xslt transformation which creates a data payload schema ignores any such `str:Attribute` definitions.

8.2.1.4.1 Dimensions

The `str:DataStructure` element shall have exactly one `str:DimensionList` child element. The `str:DimensionList` element shall have all of the following child elements:

625

- a `str:Dimension` with a `str:ConceptIdentity/Ref` child which refers to the concept in the mandatory concept scheme with `@id='dataElement'`.
- a `str:Dimension` with a `str:ConceptIdentity/Ref` child which refers to the concept in the mandatory concept scheme with `@id='orgUnit'`.
- a `str:TimeDimension` with a `str:ConceptIdentity/Ref` child which refers to the concept in the mandatory concept scheme with `@id='period'`.

630

635

The `str:DimensionList` may contain additional `str:Dimension` elements which refer to concepts which are provided by one or more `str:ConceptSchemes` outside of the ADX mandatory ConceptScheme. These may be used by a Content Data Structure Creator to provide additional optional disaggregation dimensions in addition to `dataElement`, `orgUnit` and `period`. The `dataElement` dimension in the sample is shown in the Figure 8.2.1.4.1-1 below:

```
<str:Dimension id="dataElement">
    <str:ConceptIdentity>
        <Ref id="dataElement" maintainableParentID="ADX_MANDATORY_CONCEPTS"
            maintainableParentVersion="1.0" agencyID="IHE_QRPH" />
    </str:ConceptIdentity>
```

645

```
<str:LocalRepresentation>
<str:Enumeration>
<Ref agencyID="WAHO" id="CL_DataElements" version="1.0"/>
</str:Enumeration>
</str:LocalRepresentation>
</str:Dimension>
```

Figure 8.2.1.4.1-1: The dataElement str:Dimension element

650

Note that, because the dataElement dimension is linked to a mandatory concept which has no str:CoreRepresentation, the Content Data Structure Creator shall provide a str:LocalRepresentation which constrains the vocabulary to that provided by a str:Codelist in the DSD.

An additional disaggregation dimension is shown in Figure 8.2.1.4.1-2 below:

655

```
<str:Dimension>
<str:ConceptIdentity>
<Ref id="ageGroup" maintainableParentID="ADX_WAHO_CONCEPTS"
      maintainableParentVersion="1.0" agencyID="WAHO"/>
</str:ConceptIdentity>
</str:Dimension>
```

660

Figure 8.2.1.4.1-2: An optional disaggregation str:Dimension element

665

Note that this str:Dimension refers to a str:Concept which has a str:CoreRepresentation so there is no requirement to provide a str:LocalRepresentation.

A dimension shall have an @id attribute if:

670

- i. it is one of the mandatory dimensions, in which case it should have an @id attribute of 'dataElement', 'orgUnit' or 'TIME_PERIOD' respectively;
- ii. the dimension is intended to be attached to the outer group as described below.

8.2.1.4.2 The TimeDimension

675

The str:TimeDimension shall have a str:LocalRepresentation child element which encloses a str:TextFormat element. The str:TextFormat shall have a @textType attribute with a value of either 'DateTime' or 'TimeRange', depending on whether the DSD is to be used for event based or routinely reported data. The choice of value for this attribute determines the xml data type for the period attribute which will be used in an ADX data payload.

| TextType | Data type of period |
|-----------------|----------------------------|
| dateTime | xs:dateTime |
| TimeRange | com:TimeRange |

680

The SDMX com:TimeRange is defined in the SDMX common namespace and is modelled after (xs:dateTime OR xs:date)/xs:duration. An informative description of the use of this data type is provided in Appendix 8F.

8.2.1.4.3 Dimension grouping

685 SDMX 2.1 allows dimensions to be grouped so that each dimension does not have to be repeated for each measure value in the payload. ADX mandates that the orgUnit and period dimensions shall be attached at the group level and that the dataElement dimension shall be attached at the data value level. Optional disaggregation dimensions can be attached at either the group or datavalue level. The informative sample ADX data payload in Appendix 8E illustrates the implication of this grouping.

- 690
- A str:Group child element with an ID of TIME_PERIOD that refers as shown in the example below to the Concept elements with ID period.
 - Under str:TimeDimension will be a str:localRepresentation element, and under this will be a str:TextFormat element with attribute textType having the value "ObservationalTimePeriod". SDMX v2.1 DSD allows many different ObservationalTimePeriod formats in data messages, but the ADX Profile further constrains these to the time periods as described in Appendix 8H.
 - The str:DataStructure element shall have exactly one str:Group child element with ID OUTER_DIMENSIONS, as shown in the following example (this specifies which data attributes must be present in a group element within a data payload conforming to this DSD).
- 700

Figure 8.2.1.4.3-1 below shows an example of the str:Group element showing the mandatory orgUnit and period dimensions as well as an additional disaggregation dimension with @id='mechanism'.

705

```
<str:Group id="OUTER_DIMENSIONS">
<str:GroupDimension>
<str:DimensionReference>
<Ref id="orgUnit"/>
</str:DimensionReference>
</str:GroupDimension>
<str:GroupDimension>
<str:DimensionReference>
```

710

```
715 <Ref id="TIME_PERIOD"/>
    </str:DimensionReference>
    </str:GroupDimension>
    <str:GroupDimension>
        <str:DimensionReference>
            <Ref id="mechanism"/>
            </str:DimensionReference>
            </str:GroupDimension>
        </str:Group>
```

720

Figure 8.2.1.4.3-1: Example of str:Group element

725 **8.2.1.4.4 The measure dimension**

ADX requires that there be a primary measure which is linked to the mandatory value concept as shown in Figure 8.2.1.4.4-1 below.

```
730 <str:MeasureList>
    <str:PrimaryMeasure>
        <str:ConceptIdentity>
            <Ref id="value" maintainableParentID="ADX_MANDATORY_CONCEPTS"
                maintainableParentVersion="1.0" agencyID="IHE" />
        </str:ConceptIdentity>
    </str:PrimaryMeasure>
</str:MeasureList>
```

735

Figure 8.2.1.4.4-1: Example of str:Group element

740 The Representation for the value concept is provided as a CoreRepresentation in the ConceptScheme. Implementers may not override this with a LocalRepresentation.

8.3 Generating the schema for an ADX data payload

ADX data within a particular jurisdiction shall be constrained by a schema which is generated from the ADX DSD. That schema shall be generated by applying the XSLT transformation given in Appendix 8B to the ADX compliant DSD file.

745 This transformation assumes that all structure elements appear inline in the DSD XML document. Where external references are used, the DSD may be pre-processed, for example using the transformation provided in Appendix 8C.

8.4 ADX Message Exchange Constraints (Informative)

750 There are implicit assumptions regarding the sharing of additional metadata between Content Creators and Content Consumers which are not covered within the scope of the ADX Profile. In

order to ensure semantic validity of the exchanged data, the constraints described below shall be specified using processes not defined by this profile:

- The dataElements to be reported for particular orgUnits. For example, reporting ‘Number of lab Tests performed’ from a health facility which did not perform laboratory tests is not constrained by ADX.
- The disaggregation dimensions which are expected for particular dataElements.
- The Value type (real or integer) expected for individual dataElements.
- Which period types are appropriate for which dataElements.

The preceding is not an exhaustive list. Other business rules that may affect interoperability may need to be established such as bounds on data values, bounds on date ranges, relationships between different dataElements (e.g., the sum of these dataElements cannot be greater than the sum of those dataElements, etc.).

755

760

1620 **Appendix 8H – (Informative) Formatting of times and time intervals in ADX**

The SDMX v2.1 DSD ObservationalTimePeriod data type allows a variety of formats for specifying time periods, with the result that there are several equivalent ways of expressing the same period. In the interest of greater and easier interoperability, the normative transform in Appendix 8B restricts the available options to an SDMX ObservationalTimePeriod. This can be either a `xs:dateTime`, or a `com:TimeRange`, as specified under the `str:TimeDimension` element of the DSD.

`xs:dateTime` is formatted as `yyyy-mm-ddThh:mm:sszzzzzz`, where:

yyyy is the year

1630 mm is the month (01-12)

dd is the day of the month (01-31)

T indicates the time (required)

hh is the hours

mm is the minutes

1635 ss is the seconds optionally followed by '.' and fractional seconds

zzzzzz is the optional time zone: a '+' or '-' followed by the hh:mm (hours and minutes) offset from UTC, or Z to indicate UTC.

All parts are required except the fractional seconds and the time zone.

1640 Examples:

2016-01-01T00:00:00 Midnight on January 1, 2016

2016-01-01T12:00:00 Noon on January 1, 2016

2016-01-01T12:00:12.34Z Noon and 12.34 seconds on January 1, 2016, UTC

2016-01-01T12:00:00+03:00 Noon on January 1, 2016, three hours ahead of UTC

`com:TimeRange` is modelled after (`xs:dateTime` OR `xs:date`)/`xs:duration`.

- `xs:dateTime` is as described above.
- `xs:date` follows the same rules as `xs:dateTime` except that the elements Thh:mm:ss are not present.

1645

- xs : duration is of the form P[n]Y[n]M[n]DT[n]H[n]M[n]S, where n is the number of units and the letters have the meaning:

P - Period indicator (always present for durations)

Y - Years (follows the number of years)

1650 M - Months (follows the number of months)

D - Days (follows the number of days)

T - Time indicator (preceding any of the following):

H - Hours (follows the number of hours)

M - Minutes (follows the number of minutes)

1655 S - Seconds (follows the number of seconds)

Examples:

2016-01-01/P1Y One-year period starting on 2016-01-01

2016-04-01/P1Y One-year period starting on 2016-04-01

2016-07-01/P6M Six-month period starting on 2016-07-01

2016-03-01/P1M One-month period starting on 2016-03-01

2016-01-03/P7D One-week period starting on 2016-01-03

2016-01-01/P1Y6M A year and six month period starting on 2016-01-01

2016-01-01T12:00:00/PT1H30M A period of 1 hour and 30 minutes starting on 2016-01-01 at 12:00 noon
